

# CAP Solar - Promold Year-Round Waterer hits the market

CAP Solar Pumps and Promold Marketing have joined forces to develop a superior year-round stock waterer. The system can be fitted with a solar/wind powered pump or can be hooked into a conventional pressure line. This gives producers more options in remote watering, whether the requirement is portable or permanent. Both companies have a long-term commitment to providing high quality products and have been serving the cattle industry for many years. "There are people in the business who claim this or that, but quite frankly the product has to stand on its own at the end of the day" points out Jason Wright of CAP Solar. "My advice to producers is to take a good hard look at the way a portable tank system is designed. We build ¼ inch thick double walled fiber reinforced poly tank shells that sandwich a minimum of 4 inches of urethane insulation. Therefore no insulation is exposed to outside elements. This also provides excellent structural integrity." The EnerCAP insulated tank is heated with a customized high efficient flameless heater that consumes ¾ lb. of propane a day. Therefore a 20 lb. bottle will last a month running 24 hours a day. The product has been rigorously tested by

producers and has proven to maintain open water in some of the most severe winter conditions. For years Promold has been setting the standard in designing a robust, user-friendly and stock-friendly waterer. Bill Cunningham of Promold has engineered one complete system with the EnerCAP integrated into his portable skid unit that has a 400 imperial gallon tank to allow greater accessibility during the non-freeze period. The unit has optional wheels and hitch to make it readily portable. Additional storage can easily be designed into the unit. Part of what motivated Bill and Jason to combine their efforts was recognizing the need for a reliable portable solution that has been lacking in the marketplace. "We're very excited about this product and would like to invite everyone to come have a closer look." With just cents/day in operating costs and well known benefits that include extending fall grazing, stand alone winter watering, increased grass utilization and keeping a big investment off thin ice, it doesn't take long to do the math and realize the short-term payback of the Promold-CAP system.
